

Karim Baba

Software Engineer, Agent Infrastructure and Crypto · San Francisco, CA

founder@karimbabasdf.com · linkedin.com/in/karim-baba-130547289 · github.com/karimbabasdf · x.com/karimbabasdf · t.me/karimbabasdf

Software engineer building the operational layer autonomous agents depend on: orchestration harnesses, key custody and transaction signing, and policy controls that require human approval before an agent takes an irreversible action. Three years of development, on chain since 2021, and based in San Francisco, where I represent 1Claw as its liaison to the city's crypto and AI founders, operators and investors.

EXPERIENCE

1Claw · Business Development & SF Liaison, Contributor 2026 to now

Security and custody infrastructure for AI agents: key custody, an LLM firewall and cross-chain transaction signing.

- Own 1Claw's San Francisco presence, sourcing partnerships, design partners and investor relationships in person at conferences, hackathons, meetups and founder circles.
- Lead technical education: the material that explains key custody, LLM firewall behavior and cross-chain signing to founders and developers evaluating agent infrastructure.
- Produce content and community programming that grows the protocol's reach and credibility.

Multisender.app · SMM / BDR 2021 to now

- Built a signal-gated lead engine that ranks organizations by likelihood to buy batch transfers, weighting recurring payouts (payroll, grants, points) over one-time events, with structural quotas so one news cycle cannot dominate the pool.
- Ran daily content for a verified brand account, choosing the surface before the topic: a standalone post caps near 850 views, while a well-placed reply in an active thread can beat the whole follower count.

PROJECTS

Warden · Multi-agent orchestration for AI coding GitHub

Parallel coding agents collide on a shared codebase. Warden isolates each one, coordinates their work, and shows sessions, process state, token spend and file activity in one live view. 80,000 lines of Rust and TypeScript across 220 files.

Tauri, Rust, React, TypeScript

Phosphor · Agent-driven DeFi with a human approval gate GitHub

Desktop app exposing 52 MCP tools so an existing AI agent subscription can run DeFi positions, with key custody, a policy engine that simulates and budget-checks every write, and in-app human approval. NEAR Intents across 30+ chains plus Hyperliquid perptuals. 50,000 lines of TypeScript, 1,200+ tests, open source and live on mainnet. TypeScript, MCP, NEAR Intents, Hyperliquid

Frontier · Self-improving multi-agent newspaper 24 editions, 2026

Every correction I made became a rule the next run loads, and rules that kept getting ignored became build gates that fail the run.

Five researchers work in parallel, then an editor and a designer. Multi-agent orchestration, Node.js, HTML

Switchboard · Business automation across phone, email and text Live since 2026

Operations automation for a supplies business I co-founded. Calls, email and text resolve to one contact record, and a voice agent answers the phone line. Intuit ships no MCP server, so I built one: ten tools over the live books (six read, four write), serving both MCP protocol revisions, that turn approved quotes into QuickBooks invoices. TypeScript, Node.js, Telnyx, Supabase, MCP, QuickBooks

STRENGTHS

- **Tools that multiply output.** Warden coordinates several coding agents on one codebase; it produced Phosphor's 50,000 lines and a mainnet deployment in three days.
- **System design.** An agent must never approve its own actions, so I build the enforcement around it: simulation, per-session budgets, destination allowlists and human approval outside its reach.
- **Agent-driven development.** Orchestration harnesses, MCP servers and the guardrails that make autonomy safe in production.
- **Delivery under pressure.** From hackathon builds to live launch dates, and the work holds up after the deadline.

CRYPTO

- On chain since 2021, with hands-on DeFi and Ethereum experience.
- Early user of the L2 wave: Arbitrum, Optimism and zkSync.
- Merged agent infrastructure with on-chain systems to build agent-driven DeFi harnesses.

EDUCATION

- Acellus Academy, high school.
- Self-directed study in software engineering, smart-contract architecture and DeFi mechanics.
