

Karim Baba.

San Francisco, CA · founder@karimbabasf.com · linkedin.com/in/karim-baba-130547289 · x.com/karimbabasf · github.com/karimbabasf · t.me/karimbabasf

Software engineer with three years of development experience across agent infrastructure, developer tooling and Blockchain systems. I have designed and shipped the operational layer autonomous agents depend on: orchestration harnesses, key custody and transaction signing, and the policy controls that require human authorization before an agent executes irreversible actions. Five years of on-chain experience since 2021 informs the smart-contract and DeFi side of that work. Since relocating to San Francisco I have become a fixture in the city's crypto and AI ecosystem, at ease in rooms with founders, operators and investors, and I represent 1Claw on the ground as its San Francisco liaison.

EXPERIENCE

Business Development & SF Liaison, Contributor · 1Claw

San Francisco · Since 2026

1Claw builds security and custody infrastructure for AI agents: key custody, an LLM firewall, and cross-chain transaction signing.

- Owned 1Claw's San Francisco presence, sourcing partnerships, design partners, and investor relationships in person across crypto and AI conferences, hackathons, meetups, and founder circles.
- Produced content and community programming to grow the protocol's awareness and credibility.
- Lead technical education for 1Claw, building the material that explains key custody, LLM firewall behavior, and cross-chain signing to founders and developers evaluating agent infrastructure.

SMM / BDR · Multisender.app

San Francisco · Since 2021

- Built a signal-gated lead generation engine that ranks organizations on likelihood to buy a batch-transfer product, scoring recurring payout mechanisms such as payroll, grants, and points above one-time events, using structural quotas rather than score weights so a single news cycle cannot dominate the pool.
- Ran daily content production for a verified brand account, meticulously selecting the surface before the topic: a standalone post caps near 850 views, while a well-placed reply under an active thread can exceed the entire follower count.

SELECTED PROJECTS

Warden · multi-agent orchestration for AI coding [GitHub](#)

A desktop app that runs several AI coding agents against one codebase at once, handling coordination, isolation, and review so parallel work does not collide. 80,000 lines of Rust and TypeScript across 220 source files.

TAURI · RUST · REACT / TS

Phosphor · agent-driven DeFi with a human approval gate [GitHub](#)

Local desktop application exposing 52 MCP tools, so an existing AI agent subscription can operate DeFi positions: key custody, a policy engine that simulates and budget-checks every write, and in-app human approval. Chain-abstracted across five mainnets, plus Hyperliquid perpetuals. 50,000 lines of TypeScript, open source and running on mainnet.

TYPESCRIPT · MCP · NEAR INTENTS · HYPERLIQUID

Frontier · AI newspaper with a self-improving memory layer 24 editions, 2026

Multi-agent newspaper built over three months. Five research agents report in parallel, an editor writes the front page, and a designer lays out a dated broadsheet. Every correction I gave an edition was written back into a persistent memory layer the next run reads, so repeat mistakes became hard gates that fail the build rather than advice nobody follows.

CLAUDE AGENTS · NODE.JS · HTML

Switchboard · business automation across phone, email and messaging handling real customers since 2026

Operations automation for a supplies business I co-founded. A voice agent answers the phone line, and calls, email and text resolve to one contact record, so every channel reads and writes the same history. Approved quotes become QuickBooks invoices automatically, and each conversation is recorded, transcribed and summarised into its own thread for a human to pick up.

TYPESCRIPT · NEXT.JS · TELNYX · SUPABASE · QUICKBOOKS

CRYPTO

- In crypto since 2021, with deep, hands-on DeFi and Ethereum experience.
- Early to the L2 wave, among early users of Arbitrum, Optimism, and zkSync.
- Active trader since 2021, with significant personal volume across cycles.
- Regular at SF events: NEARCON, Cursor Compile, Founders Inc, and more.

STRENGTHS

- **Tooling as leverage.** I build the systems that accelerate my own delivery, then apply them: Warden coordinates several coding agents against a single codebase, which produced 50,000 lines of Phosphor and a mainnet deployment within three days.
- **Security-first system design.** I established that an autonomous agent must never approve its own actions, and implemented the enforcement layer: transaction simulation, per-session budgets, destination allowlists, and human approval outside the agent's control.
- **Commercial judgment in architecture.** I designed Phosphor to run on inference the user already pays for, reducing the marginal cost per user to zero.
- **Full business ownership.** I delivered the operating stack for a supplies company, covering quote generation, order pipeline, invoicing, telephony, and carrier compliance.

EDUCATION & LEARNING

- Self-directed study in software engineering, smart-contract architecture, and DeFi mechanics.
- Acellus Academy, high school.
