

Karim Baba

Software Engineer · Agent Infrastructure · Crypto

San Francisco, CA · founder@karimbabaf.com · linkedin.com/in/karim-baba-130547289 · x.com/karimbabaf · github.com/karimbabaf · t.me/karimbabaf

Software engineer with three years of development experience across agent infrastructure, developer tooling and Blockchain systems. I have designed and shipped the operational layer autonomous agents depend on: orchestration harnesses, key custody and transaction signing, and the policy controls that require human authorization before an agent executes irreversible actions. Five years of on-chain experience since 2021 informs the smart-contract and DeFi side of that work. Since relocating to San Francisco I have become a fixture in the city's crypto and AI ecosystem, at ease in rooms with founders, operators and investors, and I represent 1Claw on the ground as its San Francisco liaison.

EXPERIENCE

Business Development & SF Liaison, Contributor · 1Claw

San Francisco · Since 2026

1Claw builds security and custody infrastructure for AI agents: key custody, an LLM firewall, and cross-chain transaction signing.

- Owned 1Claw's San Francisco presence, sourcing partnerships, design partners, and investor relationships in person across crypto and AI conferences, hackathons, meetups, and founder circles.
- Produced content and community programming to grow the protocol's awareness and credibility.
- Lead technical education for 1Claw, building the material that explains key custody, LLM firewall behavior, and cross-chain signing to founders and developers evaluating agent infrastructure.

SMM / BDR · Multisender.app

San Francisco · Since 2021

- Built a signal-gated lead generation engine that ranks organizations on likelihood to buy a batch-transfer product, scoring recurring payout mechanisms such as payroll, grants, and points above one-time events, using structural quotas rather than score weights so a single news cycle cannot dominate the pool.
- Ran daily content production for a verified brand account, meticulously selecting the surface before the topic: a standalone post caps near 850 views, while a well-placed reply under an active thread can exceed the entire follower count.

SELECTED PROJECTS

Warden · multi-agent orchestration for AI coding

GitHub

Parallel AI coding agents collide on a shared codebase. Warden gives each one isolation, coordinates their work, and puts sessions, process state, token spend and file activity in a single live view. 80,000 lines of Rust and TypeScript across 220 source files.

Tauri · Rust · React / TS

Phosphor · agent-driven DeFi with a human approval gate

GitHub

Local desktop application exposing 52 MCP tools, so an existing AI agent subscription can operate DeFi positions: key custody, a policy engine that simulates and budget-checks every write, and in-app human approval. Chain-abstracted through NEAR Intents across 30+ chains, plus Hyperliquid perpetuals. 50,000 lines of TypeScript and 1,200+ tests, open source and running on mainnet.

TypeScript · MCP · NEAR Intents · Hyperliquid

A newspaper that fixes itself, across 24 editions. Every correction I made became a rule the next run loads, and the rules that kept getting ignored became build gates that fail the run. Five researchers work in parallel, then an editor and a designer.

Multi-agent orchestration · Node.js · HTML

Switchboard · business automation across phone, email and messaging

handling real customers since 2026

Operations automation for a supplies business I co-founded. Calls, email and text resolve to one contact record, so every channel reads and writes the same history, and a voice agent fields the phone line. Intuit ships no MCP server, so I built one: ten annotated tools over the live books, six read-only and four writes, serving both MCP protocol revisions from a single factory. Approved quotes become QuickBooks invoices through it.

TypeScript · Node.js · Telnyx · Supabase · MCP · QuickBooks

CRYPTO

- In crypto since 2021, with deep, hands-on DeFi and Ethereum experience.
- Early to the L2 wave, among early users of Arbitrum, Optimism, and zkSync.
- Merged agent infrastructure with on-chain systems to build agent-driven DeFi harnesses.

STRENGTHS

- **Tooling as leverage.** I build the systems that accelerate my own delivery, then apply them: Warden coordinates several coding agents against a single codebase, which produced 50,000 lines of Phosphor and a mainnet deployment within three days.
- **System design.** I settle the rule before the code. An autonomous agent must never approve its own actions, so I built the enforcement layer around it: transaction simulation, per-session budgets, destination allowlists, and human approval outside the agent's reach.
- **Agent-driven development.** I build with agents and for them: orchestration harnesses, MCP servers, and the guardrails that make an autonomous system safe to point at production.
- **Delivery under pressure.** I work best shipping against a clock, from hackathon builds to live launch dates, and the work holds up after the deadline passes.

EDUCATION & LEARNING

- Self-directed study in software engineering, smart-contract architecture, and DeFi mechanics.
- Acellus Academy, high school.
